DETAILED ACTION

Claim Rejections - 35 USC 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 89-94 are rejected under 35 U.S.C. 103(a) as being unpatentable over (Crevasse et al.-6,261,958 or Bowman et al.-6,244,941, alone)or in view of Horowitz '261. Both references discloses attaching a support/pad to a platen through the use of electromagnetic attractive force. The references do not use 'electrostatic' force. However, it would have been obvious to one of ordinary skill in the art at time invention was made to substitute electromagnetic force with electrostatic force since examiner takes Official Notice of the equivalence of electrostatic and electromagnetic forces for their use in the gripping art and the selection of any of these known equivalents to hold a planarizing medium on a platen would be within the level of ordinary skill in the art. Applicant also disloses that either type of force would work equally well.

In addition, in Horowitz-'261, electrostatic attraction is taught to hold one item against another and the advantages of using such force is given. Therefore, it would have been obvious to one of ordinary skill in the art at time invention was made to use electrostatic forces in the

Application/Control Number: 09/928173 Page 3

Art Unit: 3723

device disclosed by Crevasse or Bowman, as taught by Horowitz-□261, since both are known for reliability, nonbreakage, and no edge exclusion.

3. Claim 99 rejected under 35 U.S.C. 103(a) as being unpatentable over Bowman et al.-6,244,941, alone)or in view of Horowitz-'261.

Bowman discloses attaching a support/pad to a platen through the use of electromagnetic attractive force and a locking device (344,342). Bowman does not use 'electrostatic' force. However, it would have been obvious to one of ordinary skill in the art at time invention was made to substitute electromagnetic force with electrostatic force since examiner takes Official Notice of the equivalence of electrostatic and electromagnetic forces for their use in the gripping art and the selection of any of these known equivalents to hold a planarizing medium on a platen would be within the level of ordinary skill in the art. Applicant also disloses that either type of force would work equally well.

In addition, in Horowitz-□261, electrostatic attraction is taught to hold one item against another and the advantages of using such force is given. Therefore, it would have been obvious to one of ordinary skill in the art at time invention was made to use electrostatic forces in the device disclosed by Bowman, as taught by Horowitz-□261, since both are known for reliability, nonbreakage, and no edge exclusion.

4. Claims 100-110 are rejected under 35 U.S.C. 103(a) as being unpatentable over (Crevasse et al.-6,261,958 or Bowman et al.-6,244,941) in view of Horowitz-□261.

Application/Control Number: 09/928,173

Art Unit: 3723

Both references disclose attaching a support/pad to a platen through the use of electromagnetic attractive force by using a conductive material on the pad and an attractive force within the platen. However, the references do not disclose having a plurality of conductive pieces within the support/pad.Horowitz-\(\pi\)261 teaches electrostatic attraction to hold one item against another by using a plurality of conductive pieces in one item. Electrostatic and electromagnetic forces are deemed functional equivalents. Therefore, it would have been obvious to one of ordinary skill in the art at time invention was made to use a plurality of conductive pieces, as taught by Horowitz-\(\pi\)261, in the pad/support disclosed by Crevasse or Bowman in order to use less conductive material and preserve the lifetime of the conductive material. In regard to claims 103,104,108, the placement of the conductive pieces would be an obvious design expedient.

Response to Arguments

5. Applicant's arguments with respect to claims 89-94,99-110 have been considered but are not persuasive to overcome the prior art rejection.

Arguments drawn to the 'Finality' are moot in view of the RCE filing. On page 7, Applicant argues that Crevasse does not disclose a plurality of conductive pieces nor retaining a pad to a platen by the use of 'electromagnetic' forces. However, Crevasse clearly discloses electromagnetic forces to attract the pad to the platen. Horowitz is used to teach conductive particles in a combination rejection which is not addressed in this argument. Applicant argues the same for the Bowman reference. Again the conductive pieces are taught by Horowitz, as well as the electrostatic forces. In regard to arguments drawn to equivalents, Applicant discloses that both methods work favorably and even amended the claims to recite 'electrostatic' over the

Application/Control Number: 09/928,173

Art Unit: 3723

previous recitation of 'electromagnetic'. Even though there are different advantages, this does

Page 3

not deem them 'unequivalent'. In regard to the combination rejection over Horowitz, the

rejection is based on substituting one attractive force for the other, not generating an

electromagnetic force with electrostatic forces. In regard to arguments on page 9, Horowitz is

only relied upon to teach electrostatic forces and to put a plurality of conductive particles in the

support.

6. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to E. Morgan whose telephone number is (703) 308-1743.
